% * Embedded Matlab Function Cal:
% *
% * Calculations:
% * 1. Calculation parameter.
% * 2. Calculation of the state variables.
% * 3. Calculation average viscosity.
% * 4. Calculation flow velocity.
% *    4.1 Initial value of the flow velocity.
% * 5. Calculation mass flow.
% *
% *
% * Assumptions:
% * 2. Mode = 0: state variables = average input variables
% *    Mode = 1: state variables = input variables higher pressure
% * 3. The gas mixture inside the volume consists of water vapor (H2O_gas),
% *    CO2 and water (H2O_liq, state: fog).
% * 4. The intial value of the flow velocity is estimated by the law of
% *    Hagen-Poiseuille. Knowing the initial value of the velocity, the
% *    initial value of the Reynolds number can be calculated. The iterative
% *    while loop has a break condition of |v_(i-1)-v_(i)| < 0.001*v_(i-1).
% *    The input pressures are cross linked. p_in_1 is transfered to the output
% *    p_1 and the other way around.
% * 5. The mass flow is calculated with a incompressible mass flow equation.
```

```
% *    This equation is only applicable for systems with low flow velocities.
% *
% *
% * Last modification : 15.03.2008
